

Many people might think they only learn in one specific way, the fact that there are so many aspects that affect our overall learning experience can go unnoticed. Focusing too much on a single learning style can actually hold you back. Real learning does not depend on a fixed style. Instead, it depends on your mindset. Having a growth mindset and the belief that you can get smarter through hard work is much more important than how you prefer to take in your information.

As a student, relying on just one style can be bad, especially in computer science. My learning is most successful when I mix these styles together. Being able to visualize a topic and add to that with hands-on practice can help me stay engaged. This helps me get past difficult topics much faster.
